1. a. Estimate Maximum Likelihood for

$$f(x) = \frac{x}{\theta^2} \exp \frac{-x^2}{2\theta^2}$$

$$\text{so Maximum Likelihood function (ML)} = \prod_1^N \frac{x_i}{\theta^2} \exp \frac{-x_i^2}{2\theta^2}$$

$$\Rightarrow \text{Maximum Log Likelihood function (MLL)} =$$

$$\sum_1^N [\log x_i - 2 \log \theta - \frac{x_i^2}{2\theta^2}]$$

$$\text{To maximize MLL we need to set } \frac{\partial MLL}{\partial \theta} = 0 \Rightarrow \sum_1^N [0 - \frac{2}{\theta} - \frac{x_i^2}{2} \frac{-2}{\theta^3}] = 0$$

$$\Rightarrow \sum_1^N [-\frac{2}{\theta} + \frac{x_i^2}{\theta^3}] = 0 \Rightarrow \frac{1}{\theta} \sum_1^N [2 + \frac{x_i^2}{\theta^2}] = 0$$

$$\Rightarrow \sum_1^N [-2 + \frac{x_i^2}{\theta^2}] = 0$$

$$\Rightarrow \sum_1^N -2 + \sum_1^N \frac{x_i^2}{\theta^2} = 0$$

$$\Rightarrow -2N + \frac{1}{\theta^2} \sum_1^N x_i^2 = 0$$

$$\Rightarrow \frac{1}{\theta^2} \sum_1^N x_i^2 = 2N$$

$$\Rightarrow \frac{\sum_1^N x_i^2}{2N} = \theta^2$$

$$\Rightarrow \hat{\theta} = \sqrt{\frac{\sum_1^N x_i^2}{2N}}$$

b.  $f(x|\alpha, \theta) = \alpha \theta^{-\alpha} x^{\alpha-1} \exp[-(\frac{x}{\theta})^\alpha]$

$$\text{so Maximum Likelihood (ML)} = \prod_1^N \alpha \theta^{-\alpha} x_i^{\alpha-1} \exp[-(\frac{x_i}{\theta})^\alpha]$$

$$\text{Maximum Log Likelihood}$$

$$\text{(MLL)} = \sum_1^N [\log \alpha - \alpha \log \theta + (\alpha - 1) \log x_i - (\frac{x_i}{\theta})^\alpha]$$

$$\text{To maximize MLL we need to set } \frac{\partial MLL}{\partial \theta} = 0$$

$$\Rightarrow \sum_1^N [0 - \frac{\alpha}{\theta} + 0 - \alpha (\frac{x_i}{\theta})^{\alpha-1} \frac{-x_i}{\theta^2}] = 0$$

$$\Rightarrow \sum_1^N [-\frac{\alpha}{\theta} + \frac{\alpha}{\theta} (\frac{x_i}{\theta})^\alpha] = 0$$

$$\Rightarrow \frac{\alpha}{\theta} \sum_1^N [-1 + (\frac{x_i}{\theta})^\alpha] = 0$$

$$\Rightarrow \sum_1^N [-1 + (\frac{x_i}{\theta})^\alpha] = 0$$

$$\Rightarrow -N + \sum_1^N (\frac{x_i}{\theta})^\alpha = 0$$

$$\Rightarrow \sum_1^N (\frac{x_i}{\theta})^\alpha = N$$

$$\Rightarrow \frac{1}{\theta^\alpha} \sum_1^N x_i^\alpha = N$$

$$\Rightarrow \theta^\alpha = \frac{1}{N} \sum_1^N x_i^\alpha$$

$$\Rightarrow \hat{\theta} = [\frac{1}{N} \sum_1^N x_i^\alpha]^{\frac{1}{\alpha}}$$

c.  $f(x) = \frac{1}{\theta} \forall 0 \leq x \leq \theta$

$$\text{so Maximum Likelihood (ML)} = \prod_1^N \frac{1}{\theta}$$

$$\Rightarrow ML = \frac{1}{\theta^N}$$

To maximize the above likelihood we need to minimize  $\theta$

But we also have a constraint that  $0 \leq x \leq \theta$

so  $\hat{\theta} = \max[x_i]$

2.  $p(x|C_1) = \frac{1}{\sqrt{2\pi}\sigma_1} \exp \frac{-(x-\mu_1)^2}{2\sigma_1^2}$

$$p(x|C_2) = \frac{1}{\sqrt{2\pi}\sigma_2} \exp \frac{-(x-\mu_2)^2}{2\sigma_2^2}$$

$$\log p(x|C_1) = -0.5 \log 2\pi - \log \sigma_1 - \frac{(x-\mu_1)^2}{2\sigma_1^2}$$

$$\log p(x|C_2) = -0.5 \log 2\pi - \log \sigma_2 - \frac{(x-\mu_2)^2}{2\sigma_2^2}$$

$$p(C|x) = \frac{P(x|C)P(C)}{P(x)}$$

$P(x)$  is constant for each class. So we can ignore this in discriminant function.

Discriminant function

$$g_1 = \log p(x|C_1) + \log p(C)$$

$$g_2 = \log p(x|C_2) + \log p(C)$$

for each test item, we can calculate  $g_1$  and  $g_2$  and classify them into classes by comparing  $g_1$  and  $g_2$ .

### 3. Multivariate Gaussian Log Likelihood estimation

$$p(x|C) = \frac{1}{(2\pi)^{\frac{d}{2}} |\Sigma|^{\frac{1}{2}}} \exp[-\frac{1}{2}(x - \mu)^T \Sigma^{-1}(x - \mu)]$$

- First read test and train file.
- From training file learn  $\mu_1, \mu_2, S_1, S_2$  by calling mean and cov function.
- calculate discriminant function by fitting to function  $g_i = \log(p(x|C_i)) + \log(C_i)$  where  $\log(C_i)$  is prior.
- calculate  $g_1$  and  $g_2$  by passing  $(\mu_1, S_1)$  and  $(\mu_2, S_2)$
- during calculation we can ignore the constant terms as they are same for both.
- compare  $g_1$  and  $g_2$  and chose class 1 if  $g_1$  is greater and 2 if  $g_2$  is greater.
- calculate the error rate by taking the fraction of number of misclassified classes by total number of test data.
- calculate shared  $S = p(C_1)S_1 + p(C_2)S_2$
- do the same steps for same covariance  $S$  by passing  $(\mu_1, S)$  and  $(\mu_2, S)$ .
